LETTER OF TRANSMITTAL

ARKANSAS GEOLOGICAL SURVEY

Little Rock, Arkansas

June 15, 1937

Hon. Carl E. Bailey, Governor,
State of Arkansas,
Little Rock, Arkansas.

Sir:

I have the honor to submit herewith Arkansas Geological Survey Information Circular 10, "List of Arkansas Oil and Gas wells," compiled under my direction by Mary L. Gibson, with the assistance of Works Progress Administration personnel.

The list contains information on 2,109 oil and gas wells and dry holes drilled in Arkansas to October 31, 1936, inclusive, and is planned primarily as an aid to prospectors. For that reason, information has been omitted on wells located in certain of the intensively drilled areas of southern Arkansas within 188 sections of land in Columbia, Nevada, Ouachita, and Union counties. A total of 6,794 wells had been drilled in these 188 sections to October 31, 1936, and the inclusion of data on these wells would have delayed publication of the report and would have added little to its value as an aid to prospectors.

It is of interest to consider the immense sums which have been expended for the drilling of oil and gas wells and dry holes in Arkansas. According to our records, the total number of wells drilled in the state to December 31, 1936, inclusive, is 8,909. Assuming the average cost of drilling rotary wells in the lowland region of southern and eastern Arkansas, during the period prior to 1937, to be \$21,000, and the average cost of drilling cable tool wells in the highland area of western Arkansas during that period, to be \$11,000 the total amount expended for drilling is \$181,659,000. The estimated value of all products extracted to December 31, 1936, (429,084,291 barrels of petroleum, 340,221,456 M. cubic feet of natural gas, and 321,828,955 gallons of natural gasoline) is \$460,801,189. The amount spent for drilling the 8,909 wells referred to is, therefore, 39.4 per cent of the total value of the products extracted, or, otherwise stated, the value of the products is 2.53 times the drilling cost. The cost of drilling the 6,874 producing wells exclusively is \$141,544,000. In this case, the cost of drilling is 30.7 per cent of the value of the products extracted, or, otherwise stated, the value of the products is 3.25 times the drilling cost.

It, therefore, follows that, if all the oil and gas wells and dry holes are considered, \$2.53 has been returned for each dollar expended for drilling. If only producing wells are considered, \$3.25 has been returned for each dollar so expended. The excess of the value of the products extracted over drilling cost for each dollar expended for drilling has been, therefore, \$1.53 for all wells and \$2.25 for producing wells. In the producing areas, this \$2.25 must pay the cost of leasing, royalties, pumping, labor, taxes, administration, and other overhead. It becomes apparent, therefore, that the net profit which has accrued to the oil and gas producing industry in the proven fields to December 31, 1936, has not been great. This, of course, does not mean that many individuals and companies have not made a great deal of money from the sale of Arkansas oil and gas, but it does indicate the average risk involved in prospecting.

The above figures do not take into consideration the value of extracted products which have accrued, or will accrue, after December 31, 1936. Exclusive of the Shuler area, which is not yet prospected, these values will probably not exceed 15 per cent of the accrued value to December 31, 1936. The estimates given, therefore, will not be greatly affected by accruals after that date.

The cost of drilling the 2,035 dry holes has been \$40,115,000. In the lowland areas of southern and eastern Arkansas, 21.1 per cent of the tests drilled have been dry, while in the interior highland area of western Arkansas, 48.2 per cent of the tests drilled have been dry. Of the total tests drilled in the state, 22.8 per cent have been dry. These figures include the dry holes drilled in the proven areas.

It is of interest to estimate the number of tests which it has been necessary to drill to discover the oil and gas producing areas in Arkansas. If we consider that part of southern Arkansas in which the character and structure of the formations is apparently most favorable for the accumulation of oil and gas in commercial quantities, and which includes some 5,900 square miles in Miller, Lafayette, Columbia, Union, and the southern portions of Little River, Hempstead, Nevada, Ouachita, Calhoun, Bradley, and Ashley counties, we find that of 986 tests drilled in this area, outside of the proven fields, 19 have discovered producing fields. Assuming that one well has been required to discover each field, the chance for the discovery of oil and gas in that area, up to the present time, has been as 19 is to 986, or as one is to 51.8. If we consider the 19 successful wells with reference to the total number of tests drilled in the Gulf Coastal Plain, including 27,620 square miles, we find that the chance for discovery in that area has been as 19 is to 1,436, or as one is to 75.5.

In eastern Arkansas, in the area lying in the Arkansas Valley in which the character and structure of the formations appear to offer the greatest possibilities for the accumulation of gas in commercial quantities, and which includes about 7,250 square miles in Crawford, Franklin, Johnson, Pope, Van Buren, Cleburne, Sebastian, and Conway, and parts of Searcy, Independence, Logan, Yell, Faulkner, White, and Scott counties, it has taken 131 tests to discover 15 gas fields. The chance for the discovery of gas in that area, therefore, up to the present time, has been as 15 is to 131, or as one is to 8.7. If we consider the 15 successful wells with reference to the total number of tests drilled in the interior highland area, including 25,715 square miles, we find that the chance for discovery in that area has been as 15 is to 234, or as one is to 15.6.

From the above, we may conclude that the relative chances for the discovery of gas in commercial quantities in the preferred areas of western Arkansas, and the discovery of oil and gas in commercial quantities in the preferred area of southern Arkansas are as 8.7 is to 51.8 or as one is to 6. In other words, the chance of finding gas in commercial quantities in the preferred area of western Arkansas has been 6 times as great as of finding oil and gas in the preferred area in southern Arkansas.

In addition to data on the character of buried formations furnished by logs of oil and gas wells, information furnished by the logs of deep water wells is, in many instances, of value. In order to supply this data, a companion volume is nearing completion, entitled "Water Wells in Arkansas," which contains basic data on 2,805 water wells.

Respectfully submitted,

State Geologist

INTRODUCTION

The compilation of the data published herein was begun in 1932. The records of the Arkansas Railroad Commission, the Office of Commissioner of Conservation and Inspection, the Arkansas Corporation Commission, and the Arkansas Board of Conservation are the principal sources of information. Their records, however, all pertain to wells drilled after March 23, 1923, at which time an act creating the Arkansas Railroad Commission, and requiring the filing of logs with that Commission, became effective. No legal requirements existed relative to the filing of well records prior to that date and, for this reason, the logs of many wells drilled are not available. Such records as are available were obtained from the files of the Arkansas Geological Survey and from oil and gas companies in Shreveport, Fort Worth, Tulsa, and Fort Smith.

The Arkansas Board of Conservation, at El Dorado, Arkansas, now has on hand logs of those wells drilled in the state since March 23, 1923, which have been filed. The Arkansas Geological Survey has these logs on file, less a considerable number of the logs of wells drilled in the producing areas and has, in addition, logs of many of the wells drilled prior to March 23, 1936.

The present list contains information on 2,109 oil and gas wells and dry holes drilled in Arkansas to October 31, 1936, inclusive, and is planned primarily as an aid to prospectors. For that reason, information has been omitted on wells located in certain of the intensively drilled areas of southern Arkansas, within 188 sections of land in Columbia, Nevada, Ouachita, and Union counties. A total of 6,794 wells had been drilled in these 188 sections to October 31, 1936, and the inclusion of information on these wells would have delayed publication of the report and would have added little to its value as an aid to prospectors. The location of these 188 sections is shown in Figure 5.

Table 1 contains information concerning the number of oil and gas wells and dry holes which have been drilled in the state, together with drilling cost data. The relations between the drilling cost and the value of the products extracted are indicated.

Table 2 shows the number of producing oil and gas wells and dry holes drilled in Arkansas from 1885 to 1936, by years, and also the quantity and value of products extracted from 1889 to 1936.

Figures 1 A and 1 B show the production of natural gas and petroleum in Arkansas, respectively. Figure 6 shows graphically the number of wells drilled by years.

ACKNOWLEDGMENTS

Acknowledgments and thanks are due to C. E. Harris, State Conservation Agent, who furnished much information from the files of the Arkansas Board of Conservation at El Dorado; to George H. Pace and William Finn, who checked the information assembled with the records of various oil and gas companies; and to Estella McKnight, who typed the report. Drafting is by Ted Medearis, William H. Moore, Pearle L. Blackman, Sibyl Thomas, Clark Blacklock, T. F. Condon and J. T. Leath.

Thanks are also due to the following individuals and companies who either assisted in checking data or permitted access to their records:

B. Peters of the Standard Oil Company of Louisiana, George W. Schneider of The Texas Company, R. R. O'Neal of the Arkansas-Louisiana Gas Company, J. C. Hamilton of the Arkansas Natural Gas Company, B. Minor and Judge J. S. Atkinson of the Gulf Refining Company, and Harry W. Bell, all of Shreveport, Louisiana; Guy Tate of the Magnolia Petroleum Company of Dallas, Texas; Ira H. Cram of the Pure Oil Company of Tulsa, Oklahoma; The Pure Oil Company of Fort Worth, Texas; and S. R. Walker of the Industrial Oil and Gas Company, and Leigh and Harry E. Kelley, all of Fort Smith, Arkansas.

HISTORY OF DEVELOPMENT

Oil and gas prospecting in Arkansas has been largely controlled by the progressive discovery of the various oil and gas fields. From 1887 to 1920, only gas had been found within the state, four fields having been discovered in western Arkansas. Following the discovery of oil in southern Arkansas in 1920, the state entered into a period of rapid development of its oil fields, and, from that year to 1937, 19 such fields had been discovered. The oil fields of Nevada, Ouachita, and Union counties have produced considerable amounts of gas but the value of the gas has not been a factor of major importance compared with the value of the oil. From 1920 to 1937, 11 new gas fields were discovered in western Arkansas.

Table 3 shows chronologically the discovery dates of the several oil and gas fields of the state. Table 2 and Figure 6 show the number of oil and gas wells and dry holes drilled from 1885 to 1936, inclusive. Figure 2 shows the locations of all wells drilled in the state outside of the 188 sections of land on which information is not given in this publication.

The first test well drilled in Arkansas, of which we have definite record, was completed in 1887 by the Choctaw Oil & Gas Company, near North 16th and I Streets in Fort Smith. The total depth was 1,400 feet and a little gas was found at 1,300 feet. The well was 4 inches in diameter. In 1889, the same company drilled a second well, in sec. 2, T. 7 N., R. 32 W., Sebastian County, to a total depth of 2,870 feet. Gas was encountered at 1,250, 1,600, and 2,100 feet. In 1889, a third well was drilled by the same company at North 7th and K Streets in Fort Smith, to a total depth of 2,000 feet. Only one

thin gas sand was encountered. In 1889, a fourth well was drilled in Sebastian County, by Harry E. Kelley, in sec. 1, T. 7 N., R. 31 W., to a total depth of 2,780 feet. A small amount of gas was obtained at 1,250 feet and gas and some oil were reported at 1,600 feet. None of these four wells was commercially productive.

In 1902, the Choctaw Oil & Gas Company completed two commercial gas wells near Mansfield, Sebastian County, in Lot 7, sec. 1, T. 4 N., R. 31 W. These were the Duncan No. 2, drilled to a total depth of 1,125 feet, with an initial production of 960,000 cubic feet, and the Duncan No. 5, drilled to a total depth of 1,050 feet, with an initial production of 400,000 cubic feet. The gas field thus found (the Mansfield field) was the first discovered in the state. Following this, the Massard Prairie field was discovered near Fort Smith in 1904. Since that year, 13 additional gas fields have been discovered in western Arkansas.

Oil was first discovered in Arkansas in S. S. Hunter's Lester & Haltom No. 1 well, which was completed on April 10, 1920, in sec. 13, T. 15 S., R. 19 W., Ouachita County. The well was drilled to 2,124 feet and was never a commercial producer, although some oil was bailed from it. Gas was first discovered in southern Arkansas on April 22, 1920, when the Constantin Oil Company completed its Hill No. 1 well, in sec. 12, T. 18 S., R. 16 W., Union County, to a depth of 2,243 feet with an estimated daily flow of 60,000,000 cubic feet. The Hunter and Constantin wells did not attract a great deal of attention, and it was not until January 10, 1921, when Mitchell & Busey's Armstrong No. 1 well, drilled to a depth of 2,233 feet, in sec. 31, T. 17 S., R. 15 W., Union County, yielded from 15,000,000 to 35,000,000 cubic feet of gas and from 3,000 to 10,000 barrels of oil and water per day, that progressive oil development began in the state. There are now 15 gas fields in western Arkansas and 19 oil and gas fields in southern Arkansas, making a total of 34 fields.

The combined acreage of the 19 oil and gas fields in southern Arkansas is 49,625 and that of the 15 gas fields in western Arkansas is 2,810. The aggregate productive acreage is, therefore, 52,435 or 82 square miles. Figures 3 and 4 show the locations of these fields.

The discovery of oil and gas at 4,897 feet in the Lion Oil Refining Company's J. D. Reynolds No. 1 well, drilled in sec. 27, T. 15 S., R. 15 W., Ouachita County, to a total depth of 4,926 feet, and the recent discovery of oil and gas at 5,544 feet, in the Lion Oil Refining Company's Edna Morgan No. 1 well, drilled in sec. 18, T. 18 S., R. 17 W., Union County, to a total depth of 5,599 feet, doubtless will initiate a period of deep drilling in Arkansas and may lead to the discovery of important new fields.

The deepest well drilled in the state is the Gulf Refining Company of Louisiana's Louis Werner No. 49 well, drilled in sec. 5, T. 16 S., R. 16 W., Union County, to a total depth of 7,973 feet. The deepest well drilled in western Arkansas is the Blackwell Oil & Gas Company's Winn No. 1 well, located in sec. 21, T. 9 N., R. 25 W., Johnson County, with a depth of 5,597 feet.

There are at present 60 wells in southern Arkansas and 14 wells in western Arkansas which have depths in excess of 4,000 feet.

1937	Oil and gas	Shuler	Union	10
				52,435 ^{d/}

^{a/} Williams field was discovered in 1918.

^{b/} According to severance tax reports filed with State Department of Revenues.

^{c/} Also referred to as Urbana field.

^{d/} The gas fields of western Arkansas total 2,810 acres, and the oil and gas fields of southern Arkansas total 49,625 acres.

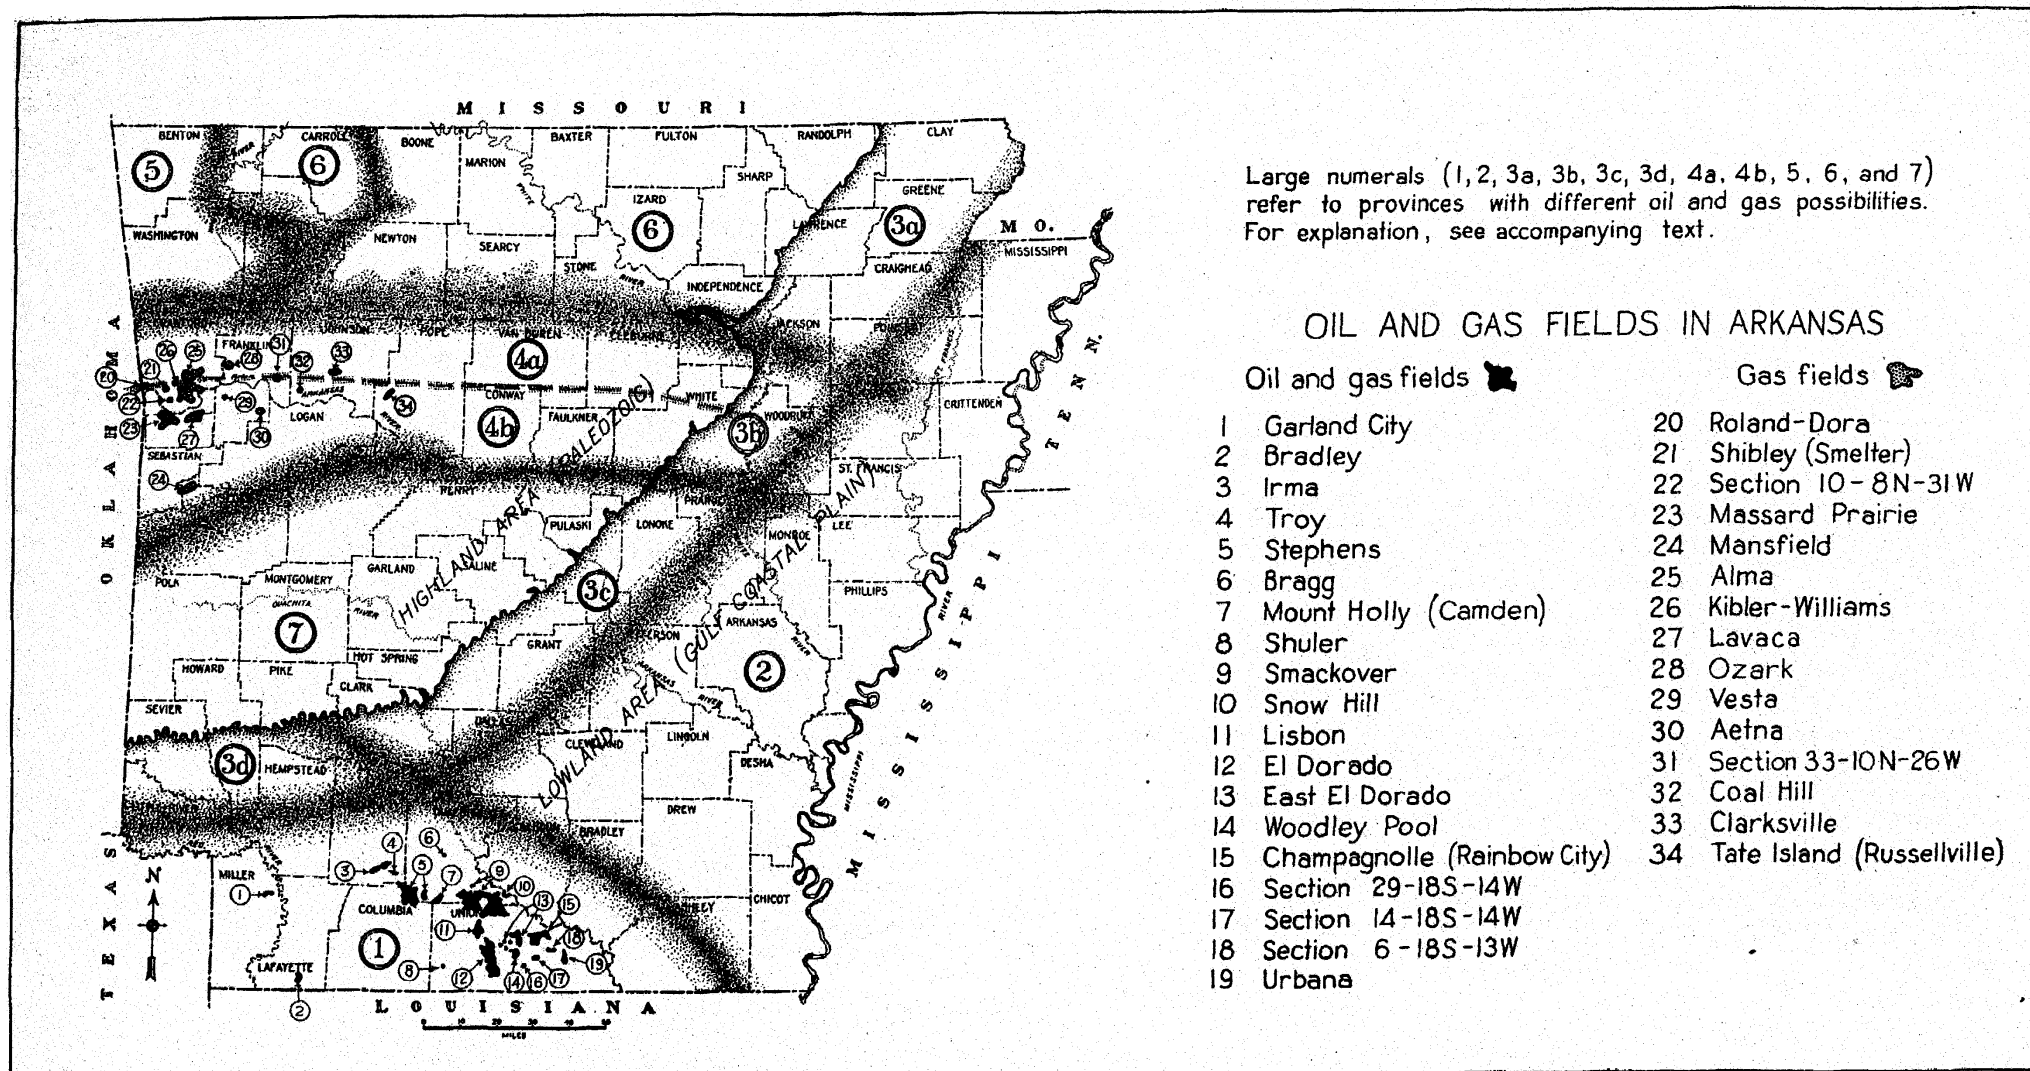

FIGURE 7. MAP SHOWING OIL AND GAS POSSIBILITIES OF PROVINCES IN ARKANSAS.

OIL AND GAS POSSIBILITIES IN ARKANSAS

I.

Possibilities in the formations making up the lowland (Gulf Coastal Plain) area of southern and eastern Arkansas

Area 1. Most favorable area for the accumulation of oil and gas. Contains all of the 19 oil-producing fields (aggregating about 49,625 acres) in the Gulf Coastal Plain in Arkansas. The area is underlaid by both the Upper and Lower Cretaceous formations, which have produced all of the oil and gas found in the Gulf Coastal Plain in Arkansas. The Upper Cretaceous formations are especially favored as oil and gas possibilities, as they have produced at least 97 per cent of the oil, and very nearly 100 per cent of the gas produced in southern Arkansas. The Nacatoch and Ozan formations, both of Upper Cretaceous age, are the most favored of the Upper Cretaceous group of formations, as the Nacatoch sand has produced about 47 per cent and the Ozan about 46 per cent of the oil, while the aggregate production by the Tokio-Woodbine formation and the Upper Cretaceous red beds has been about 4 per cent. The Lower Cretaceous formations have accounted for about 3 per cent of the oil produced. Structures favorable for the accumulation of oil and gas in commercial quantities (anticlines, domes, structural terraces, and faulted zones) are known to be present.

The discovery of gas and oil in the beds of undetermined age in the Snow Hill area, in the Phillips Petroleum Company's J. D. Reynolds No. 1 well, and in the Shuler area, in the Lion Oil Refining Company's Edna Morgan No. 1 well, is too recent to appraise. The producing formations are apparently the lower portion of the Travis Peak formation

(Lower Cretaceous, Trinity group). These wells may lead to the discovery of important deep production, although much deep drilling will have to be done before the significance of these discoveries is known.

Area 2. Somewhat less favorable than Area 1 for the accumulation of oil and gas, because basal Upper Cretaceous formations, which are present in Area 1 are absent over the greater part of Area 2, and the Lower Cretaceous formations are wholly absent. Shows of oil and gas have been reported. Structures favorable for the accumulation of oil and gas in commercial quantities may occur but they are not definitely known to be present.

Area 3 a, b, and c. Only slightly favorable for the accumulation of oil and gas. Upper part of the Upper Cretaceous group of formations is present in part of the area only, and is relatively thin. Lower Cretaceous formations are absent.

Area 3 d. Less favorable for the accumulation of oil and gas than Areas 1 and 2, but more favorable than Areas 3 a, b, and c. Lower Cretaceous formations are exposed in northern and Upper Cretaceous formations are exposed in southern part of the area. Both groups of formations are relatively thin compared with their thicknesses in the southern part of Area 1.

II.

Possibilities in the formations making up the highland (Paleozoic) area of western and northern Arkansas

Area 4 a. The majority of the anticlines and domes are favorable for the accumulation of gas. Area is one of gentle folding. Thirty-seven anticlines have been mapped in this area. Surface formations are Atoka of Pennsylvanian age, or younger, and, in the aggregate, vary in total thickness from about 2,000 to 5,000 feet. Some possibility for the accumulation of oil in formations lying beneath the Atoka, in which structural conditions are favorable. It is believed that testing below the Atoka formation should extend at least into the St. Peter sandstone. Contains Alma, Clarksville, and Ozark gas fields. Also a small field extending from Roland, Oklahoma, to Dora, Arkansas, which produces from the Hale formation of Pennsylvanian age.

Area 4 b. The majority of the anticlines and domes are favorable for the accumulation of gas. Area more intensely folded than Area 4 a. Thirty-nine anticlines have been mapped in this area. Surface formations are Atoka of Pennsylvanian age, or younger, which, for the most part, have a thickness of 6,000 feet or over. Formations lying beneath the Atoka believed to offer some chance for the accumulation of oil but possibility not as favorable as Area 4 a. Contains Shibley, Section 10, Massard Prairie, Mansfield, Kibler-Williams, Lavaca, Vesta, Aetna, Section 33-10N-26W, Coal Hill, and Tate Island gas fields.

The Paleozoic formations of Areas 4 a and b extend beneath the Gulf Coastal Plain formations of Area 3 b, and the chances for finding oil or gas in the covered Paleozoic beds there are the same as in the eastern portions of Areas 4 a and 4 b. It is impossible, however, to locate accurately structural axes in Paleozoic rocks which are buried beneath the Gulf Coastal Plain formations.

Area 5. Good chance for small accumulation of gas under favorable structural conditions. The possibility of the accumulation of oil in commercial quantities is not encouraging. Surface principally Boone formation. Principal porous sandstone formations which lie beneath the Boone formation are (where present) the Sylamore sandstone member of the Chattanooga shale, the St. Peter sandstone, the Calico Rock, and the King's River sandstone members of the Everton formation.

Area 6. Chances for the accumulation of oil or gas in commercial quantities remote. Surface formations are principally Lower Ordovician dolomites and limestones, which are underlaid by rocks of Cambrian age resting on granite. Results of prospecting have not been encouraging.

The Paleozoic formations of Area 6 extend beneath the Gulf Coastal Plain formations of Area 3 a, and the chances for finding oil or gas in the covered Paleozoic beds there are the same as in the eastern part of Area 6.

Area 7. Offers no reasonable chance for the accumulation of oil or gas in commercial quantities. Intensely folded rocks of Ouachita Mountains, which are principally sandstones and shales of Pennsylvanian, Mississippian, Devonian, Silurian, Ordovician, and Cambrian age. Rocks often highly altered.

The Paleozoic formations of Area 7 extend beneath the Gulf Coastal Plain formations of Areas 3 c and 3 d, and the chances for finding oil or gas in these covered Paleozoic beds there are the same as in Area 7.

USE OF DATA

The data shown in the accompanying list include information on 2,109 wells drilled in Arkansas to October 31, 1936, inclusive. Information on the 6,795 wells drilled in the 188 sections of land in the producing area of southern Arkansas (in Columbia, Nevada, Ouachita, and Union counties) has not been included. The 188 sections of land on which data are not given are shown in Figure 5.

The wells in this list are grouped by counties and arranged alphabetically by owners. The county maps are arranged alphabetically by counties from pages 80 to 103.

The following explanations are given of certain headings of the list:

<u>Map No.</u>	The map number shown in the first column refers to the numbers on the county map. County maps are arranged alphabetically in the back of the book.
<u>Owner.</u>	If a well was begun by one owner and later taken over by another, a cross reference is made.
<u>Total depth.</u>	If a location was made and no well drilled, or if no data is available concerning the drilling of the well, it is listed but is not numbered or spotted on the corresponding county map. In case the final depth of the well is not known, the last depth of record is shown and a plus sign is added.
<u>Drilling dates.</u>	When neither the date on which the well was begun, nor the date on which it was completed, is known, the date on which the permit to drill or the date on which the permit to abandon, was issued, is given in the "Remarks" column.
<u>Logs on file.</u>	Logs marked "AGS" are on file with the Arkansas Geological Survey. Logs marked "ABC" are on file with the Arkansas Board of Conservation at El Dorado, Arkansas. Starred (*) logs are incomplete.

Other column headings of the list are self-explanatory.

In view of the large number of items set out in this report and the various sources from which the information was secured, it is inevitable that some errors and omissions exist. The Arkansas Geological Survey would appreciate receiving information as to these, in order that future lists may be corrected.

A list of the abbreviations used follows.
