NOTICE OF REVISION

The original version of this report included a separate package of 29 map sheets. Most were reproduced at their original scale of 1:24,000 although one, which covered two 7½-minute quadrangles, was reproduced at 1:62,500. While these maps met the scale requirements of the Bureau of Land Management contract under which the report was prepared, they are inconveniently large for purposes of wider distribution. Consequently, they have been recompiled for the present report and are reproduced here as page-sized maps at a uniform scale of 1:62,500. Practical considerations dictated that some information shown on the original maps be deleted. The deleted items of information are the extent of known underground and surface mines, the total thickness of individual coal sequences encountered at each locality, and the code identifying the name or stratigraphic position of the coal sequences. The last two items are provided in table 1. Information on the extent of mined areas can be obtained from the Arkansas Geological Commission, where the original compilation maps are available for inspection or for reproduction at the user's expense.

**DATA FOR THE ASSESSMENT
OF FEDERAL COAL RESOURCES
OF ARKANSAS**

by
William V. Bush and George W. Colton

INTRODUCTION

The Arkansas Valley coal field (fig. 1) covers an irregular area of approximately 1,140 square miles in west-central Arkansas. As defined in this report, the field includes all areas in the Arkansas Valley region that are underlain by the McAlester and younger Formations. In common with earlier definitions of the coal field (Collier, 1907; Haley, 1954, 1977), scattered coal beds present in the underlying Atoka Formation are excluded from the field. Some of these beds have been mined on a small scale. If, in the future, individual coal beds in the Atoka Formation are mapped, and become of economic importance, then the boundaries of the coal field could be expanded to include all mineable coals in the Arkansas Valley region. The field is bounded on the north by the Boston Mountains of the Ozark Plateau and on the south by the Ouachita Mountains. Elongate in an east-west direction, the coal field is transected longitudinally by the navigable Arkansas River. Parts of Conway, Crawford, Franklin, Johnson, Logan, Perry, Pope, Scott, Sebastian, and Yell Counties are included in the field.

The present study (fig. 2) is restricted to 29 of the 50 7-½ minute quadrangles which cover all of the Arkansas Valley coal field, but includes one additional quadrangle, the Lee Mountain quadrangle, which lies outside of the field proper. The 30 quadrangles are those which contain lands to which the Federal government owns the mineral rights. Most of these lands are administered by the U. S. Forest Service (96,360 acres), the Department of Defense (61,975 acres), and the U. S. Army Corps of Engineers (51,000 acres), but a few (totaling 1,857 acres) are privately owned.

Acknowledgments. — We thank Boyd R. Haley, U. S. Geological Survey, Little Rock, Arkansas for a great deal of freely-offered advice and information, and for making his very extensive files of data available. We also thank Loretta Chase who, working continuously for many weeks, is solely responsible for setting up the many pages of table in this report. Finally, our thanks to Susan Young, who assisted in several stages of preparing the maps and the report.

PURPOSE OF THIS STUDY

The Federal Government owns the mineral rights to approximately 211,192 acres of land in known coal-bearing areas in the state of Arkansas. Management of the mineral resources on these lands is the responsibility of the Bureau of Land Management (BLM), U. S. Department of the Interior. The BLM let out this contract (AA851-CT1-62) to obtain the available geologic information relating to coal in order to plan for the proper management of this resource. The major objectives of the present report are to provide the BLM with tabulations of existing publicly available data, and to locate on a series of topographic maps all sites where data are available.

Items specifically requested in the contract are:

- 1) An identification number for each site.
- 2) Type of site where data were obtained.
- 3) Location by coordinates in the Universal Transverse Mercator grid system.
- 4) Location within the Public Lands subdivisions.
- 5) Elevation of the ground surface.
- 6) Elevation of the base of each coal 6 inches or more in thickness.
- 7) Thickness of each coal bed 6 inches or more in thickness.
- 8) Thickness of the interval between successive coal beds.

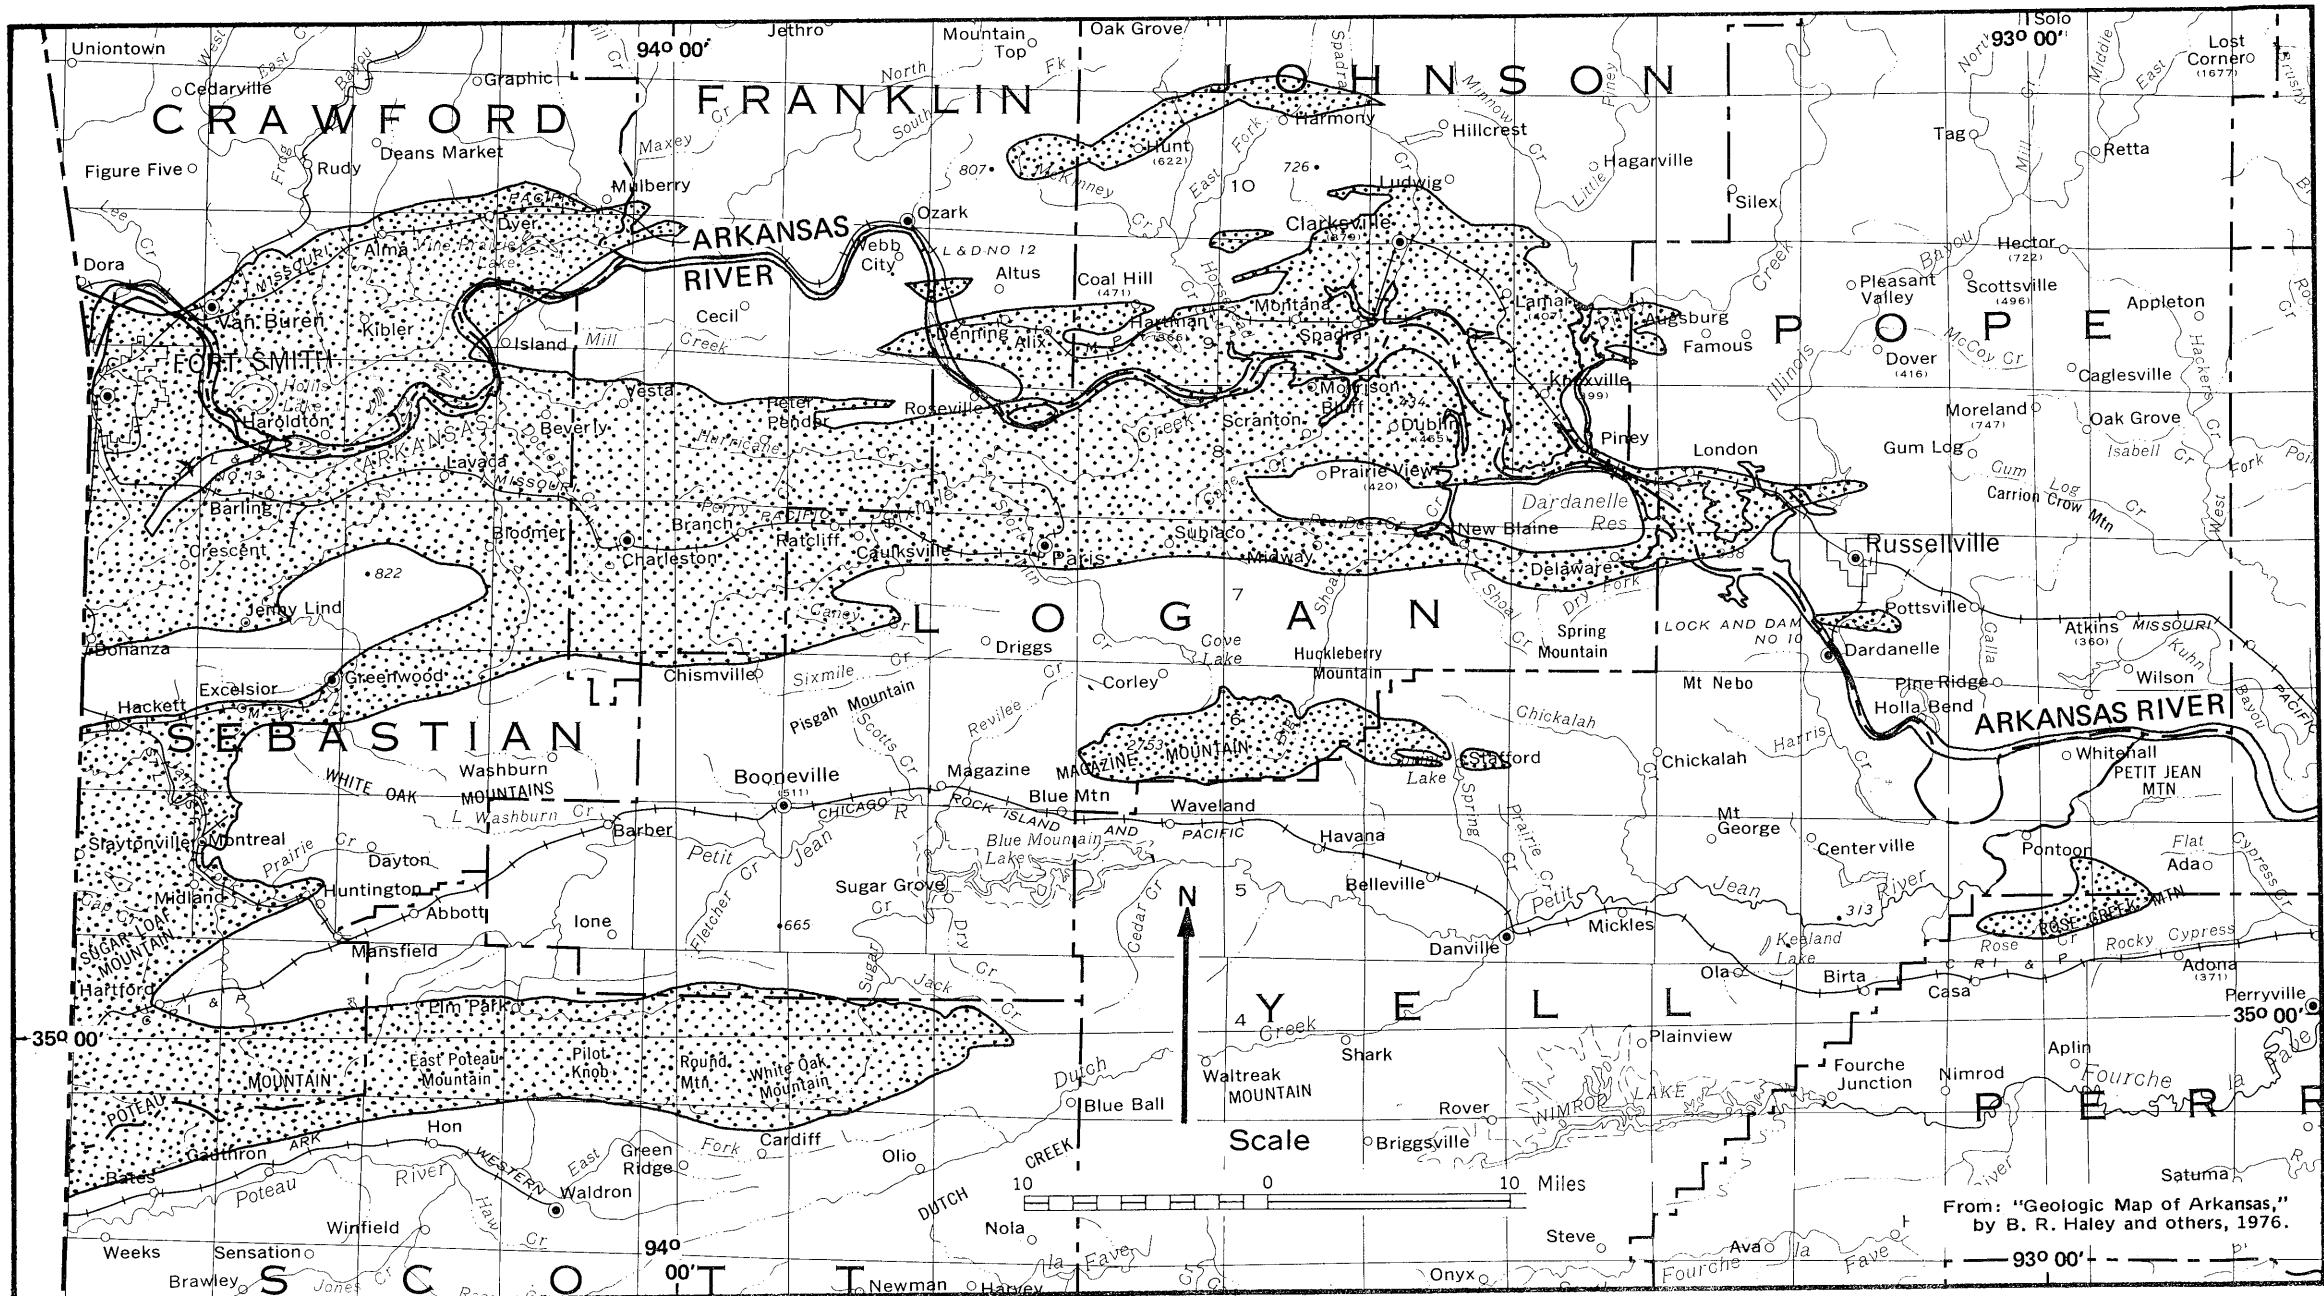

FIGURE 1. — Map showing extent (stipple pattern) of the Arkansas Valley coal field as drawn on the base of the McAlester Formation. As so defined the field includes all areas underlain by the Lower Hartshorne and younger coal beds but excludes older coal beds in the Atoka Formation. Irregular outline and isolated basins show the effects of structural deformation and erosion.

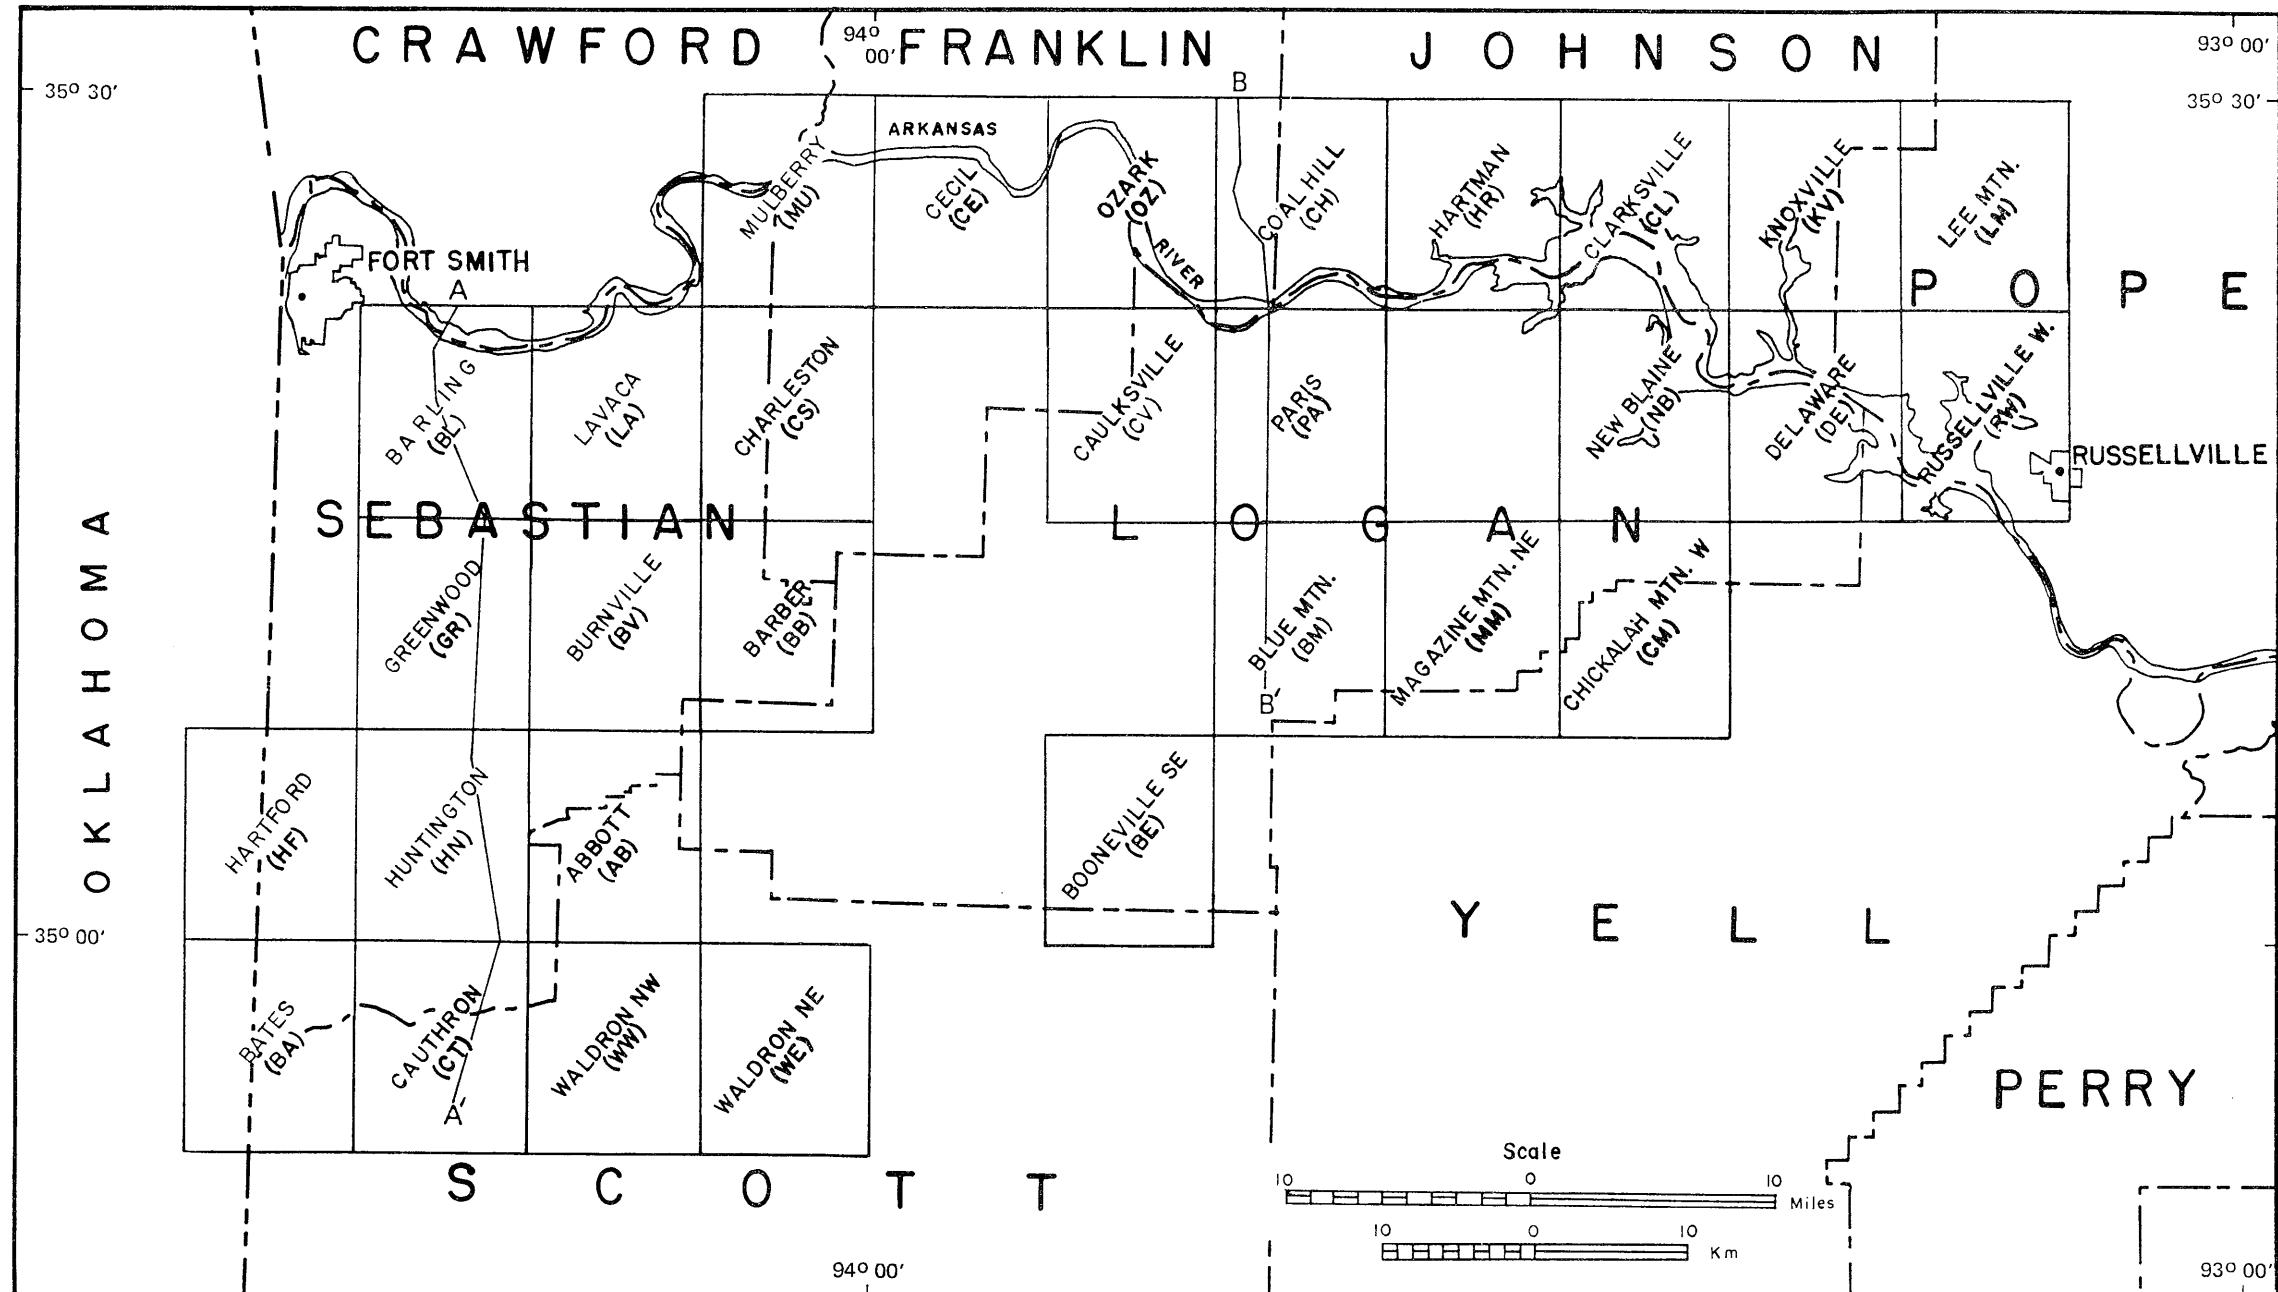

FIGURE 2. — Index map of quadrangles in this report, western Arkansas Valley, Arkansas. The quadrangle code used elsewhere in this report is shown in parentheses. Quadrangles shown as Waldron NE and Waldron NW are the north quadrants of the Waldron 15-minute quadrangle. Lines of structural sections A-A' and B-B' in Figure 4 are also shown.

- 9) Thickness of overburden (interval between top of the coal bed and the ground surface).
- 10) Analyses, where available, of the coal.
- 11) Information on deformation or weathering that may affect the condition of the coal.

In view of the structural complexity of the Arkansas Valley coal field, we thought it necessary to provide additional information. Consequently, the maps that accompany this report also show the outcrop trace of coal beds and faults wherever these have been mapped by earlier workers. In addition we have outlined and distinguished between all areas that have been mined out by either underground or surface methods.

GENERAL GEOLOGY

Stratigraphy. — Exposures of bedrock occupy a very small percentage of the area of the Arkansas Valley. Most of the area is covered by unconsolidated materials such as soil, colluvium, alluvium, and stream terrace deposits. These materials range in thickness from a few inches to as much as 260 feet (Hendricks and Parks, 1937, p. 201). As a consequence, naturally occurring exposures of coal are extremely rare.

Bedrock exposed in the coal field or in the immediate vicinity is entirely of Pennsylvanian age and belongs to the Atoka, Hartshorne Sandstone, McAlester, Savanna, and Boggy Formations. The lithology and thickness of these formations, and the coals they contain, are summarized in figure 3. With the exception of the Hartshorne, which consists largely of sandstone, the other formations consist largely of very dark gray to black shale and shaly siltstone and lesser amounts of lighter-colored sandstone, commonly shaly or silty. However, because of its greater resistance to weathering, a disproportionate share of the outcrops are sandstone, and sandstone underlies most of the ridges and more mountainous areas of the coal field.

Structure. — The Arkansas Valley coal field is complexly deformed by folding and faulting (fig. 4). Most of the folds and faults trend approximately east-west, parallel to the long axis of the field. The northern part of the field contains many relatively gentle folds and many faults, most of which are normal and whose displacement is down to the south. However, a few south-dipping reverse faults are also present. The southern part contains fewer folds and faults, but typically having larger amplitudes and displacements respectively. Some south-dipping thrust faults are present at the east and west ends of the coal field. However, these cut the Hartshorne Sandstone and Atoka Formation and are therefore outside of the coal field proper as defined in this report. Structural deformation has both facilitated and complicated mining operations.

Coal. — Mineable coal beds are present in the Atoka, McAlester, and Savanna Formations. Stratigraphic control is not adequate to determine the thickness and extent of individual beds except locally. However, several sequences consisting of two or more closely spaced coal beds are known to be extensive throughout large parts of the coal field. These include the Lower Hartshorne coal bed near the base of the McAlester Formation, and the Charleston coal bed and Paris coal bed in the lower and upper parts respectively of the Savanna Formation (fig. 3). Another, the Upper Hartshorne coal bed, typically 60-90 feet above the Lower Hartshorne coal sequence, occurs extensively in the southwestern part of the coal field. The other coal beds in the McAlester, and Savanna Formations, and in the underlying Atoka Formation are less extensive and have been mined only locally.

The Lower Hartshorne coal sequence underlies a much larger area and typically contains thicker coal beds than do the other producing coal sequences. In fact, data provided by Haley (1960, tables 1, 2) show that 93% of the original coal reserves ^{1/} in the Arkansas

^{1/} These reserve figures exclude all coal beds less than 14 inches thick, all coals other than those in the Lower and Upper Hartshorne, Charleston and Paris coal sequences, and all coal beds beneath more than 3,000 feet of overburden. Coal reserves in the Atoka Formation have not been calculated.

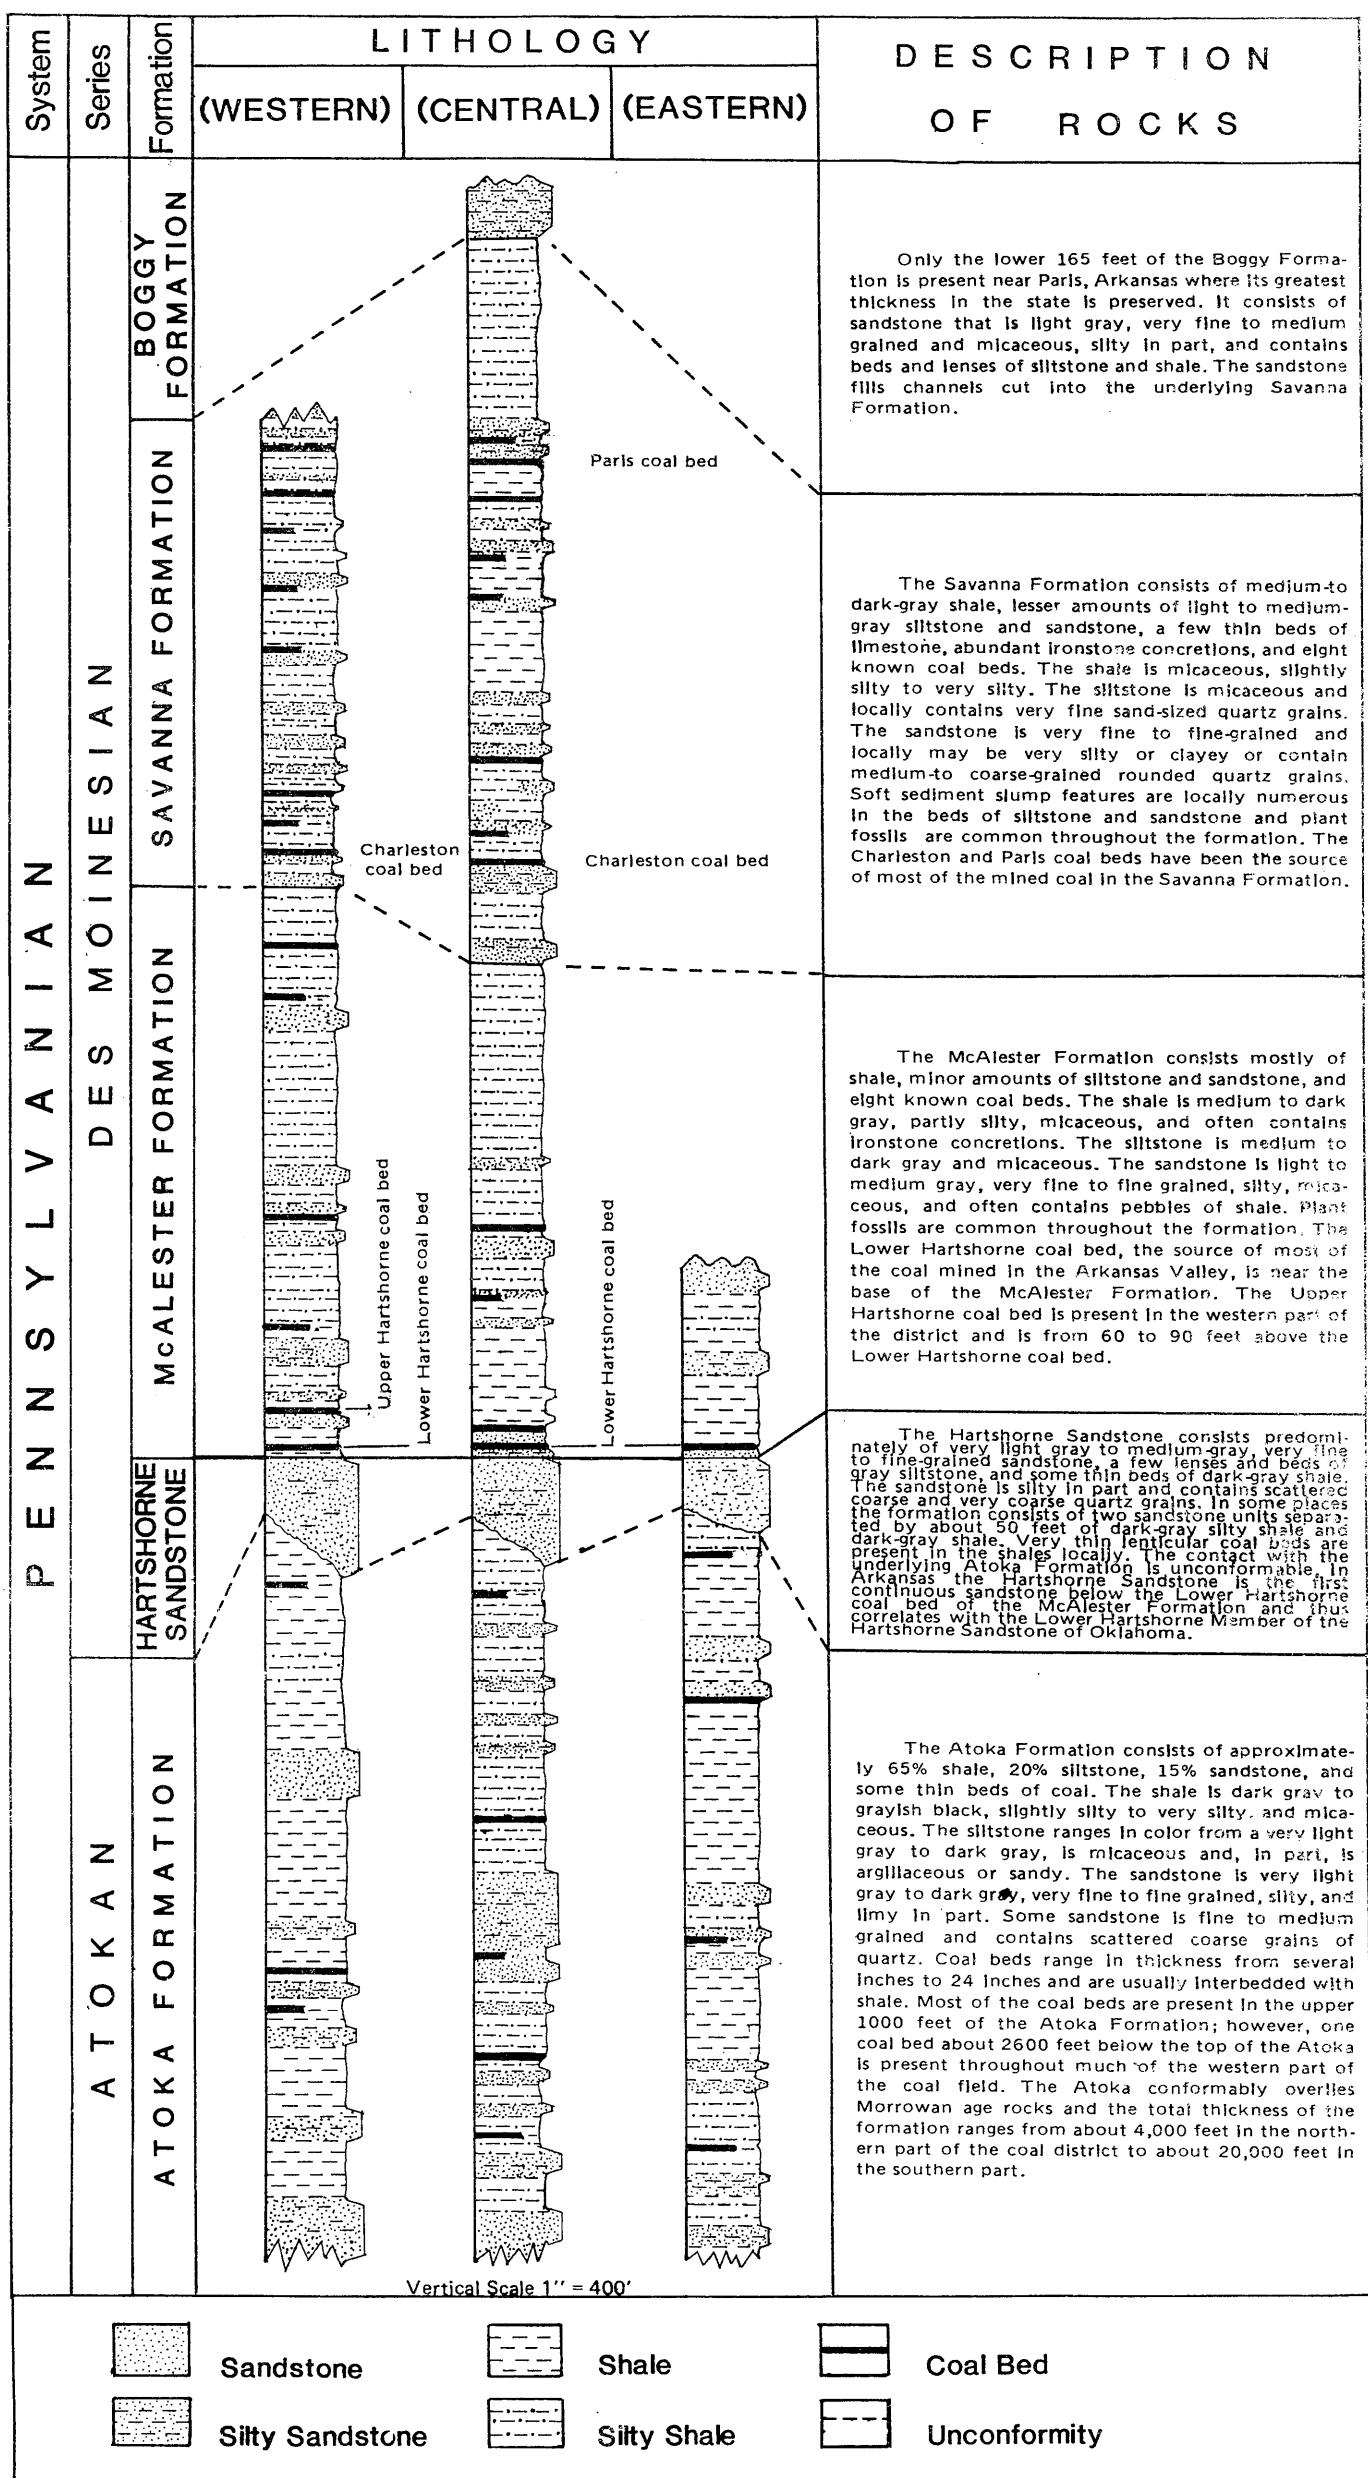

Figure 3. — Generalized stratigraphic sections in the Arkansas Valley coal field.

Valley coal field were in the Lower Hartshorne. Although figures are not available for production from individual coal sequences, the bulk of the production to date from the coal field has been from the Lower Hartshorne. Total production from all coals within the State of Arkansas up to the end of 1981 (Haley, 1960; Bush and Gilbreath, 1978; Bush, written commun.) has been about 105,000,000 short tons.

Coal increases in rank from low-volatile bituminous in the western part of the Arkansas Valley coal field to semi-anthracite in the eastern part. As drawn by Haley (1977), the boundary line between the two ranks extends northward through the eastern part of the Paris and Coal Hill quadrangles, then eastward shortly beyond the north edges of the Hartman and Clarksville quadrangles.

METHOD OF COMPILED AND SOURCES OF DATA

The data pertinent to assessing coal resources in the designated parts of the Arkansas Valley coal field are contained primarily in a series of topographic quadrangle maps and in five tables. The thirty maps included in this report show the following:

- 1) Location and thickness of known outcrops of coal beds.
- 2) Outcrop traces of coal beds where mapped by earlier workers.
- 3) Location of known coal mine shafts and slope entries.
- 4) Outer limits of mined-out areas in underground mines.
- 5) Extent of strip mine operations, --including areas covered by spoil banks.
- 6) Location within underground and strip mines where coal sections have been measured or samples have been collected for analysis.
- 7) Location of exploratory bore holes for coal in which coal beds 6 inches or more in thickness have been encountered.
- 8) Location of wells drilled for natural gas in which coal beds 6 inches or more in thickness have been reported.
- 9) By means of a letter code, the approximate stratigraphic position of the coal beds encountered, or where known, their names.
- 10) The location of mapped faults and their relative sense of displacement where known.

The items of information listed above were obtained from many sources, both published and unpublished. Published geologic quadrangle maps and reports (Haley, 1961, 1966, 1968; Haley and Hendricks, 1968, 1971; Merewether, 1967, 1971; Merewether and Haley, 1961, 1969; Reinemund and Danilchik, 1957) were especially valuable and provided the geologic framework within which other data were added. From these reports, well locations, measured coal thicknesses, and the outcrop traces of coal beds and of faults were transferred to the maps that accompany this report. The same types of data were also transferred from compilation copies of unpublished geologic quadrangle maps of several areas that have been mapped by H. H. Arndt, E. E. Glick, B. R. Haley, and E. A. Merewether, all of the U. S. Geological Survey. Some quadrangles in the study area have not been mapped in detail. For these, fault traces were obtained from a set of reconnaissance maps (in the open files of the Arkansas Geological Commission) which were compiled in the course of preparing the "Geologic Map of Arkansas (Haley, and others, 1977). Several quadrangles that had not been mapped contained so little data on coal beds that we felt it necessary to add geologic contacts—in addition to faults—so that the user could better visualize the general outcrop trend of the more persistent coal sequences. The geologic contacts were transferred from the same set of open-filed maps. These are the Booneville SE, Blue Mountain, Chickalah Mountain West, and Magazine Mountain quadrangles.

Many additional data on the thickness of coal beds were obtained from well logs in the files of the U. S. Geological Survey and the Arkansas Geological Commission. These included resistivity, self-potential, drillers', and geologists' sample logs from both deep wells drilled for gas and from shallower exploration holes for coal. Other data were gathered from tables and maps in earlier publications. All data were compiled on a set of point source information cards and were later incorporated into the maps and tables in this report.

Table 1 primarily summarizes information on the location of control points, the identity of coal beds, thickness of individual beds and of partings between them, and the amount of overburden and elevation of the beds. The data in this table were obtained from one or more (most commonly more) of the sources listed earlier.

Data for the proximate and ultimate analyses in table 2 were obtained from four sources: 1) an early tabulation by the U. S. Geological Survey (Collier, 1907), 2) early publications of the U. S. Bureau of Mines (Fieldner and others, 1918, 1922; Lord and others, 1913), 3) a more recent publication by the Arkansas Geological Commission (Haley, 1977), and 4) a few yet more recent unpublished analyses provided by B. R. Haley from U. S. Geological Survey files.

Tables 3, 4 and 5 are slightly restructured versions of unpublished tabulations prepared by B. R. Haley. We included several additional entries from very recent analyses that had not been included in his original tabulations.

The laboratories and analysts involved are credited at the end of tables 2 through 5.

Miscellaneous comments. — The quality of data incorporated into this report may vary, owing to the wide scope of the source materials. Some of the more significant problems are listed below.

- 1) By previous agreement we have not tabulated data for sites where less than 6 inches of coal have been reported. Such sites are not numbered on the maps and do not appear in table 1. However, to furnish some information on the location of outcropping coal beds we have shown coal outcrops on the locality maps regardless of the coal bed thickness.
- 2) We have arbitrarily defined coal beds (6 inches or more in thickness) separated from other coal beds by 10 feet or more of intervening rock as belonging to separate sequences. Each coal sequence at a site, for example a drill hole or the headwall of a strip mine, will appear as a separate line entry in table 1 but with the same identification number. Conversely all coal beds separated by less than 10 feet of rock are defined as belonging to the same sequence and the thickness of individual beds will be noted in table 1.
- 3) In some underground and surface mines only the coal bed that was being worked was measured. Other beds may be present above or below, but because they were not measured or reported we could not determine their contribution to the total thickness of coal present at such sites.
- 4) Many mine shafts, slope entries, and some other control points were transferred from a variety of old maps based on very early surveys, commonly having much smaller scales and invariably without a Universal Transverse Mercator grid. These sites were transferred by visual inspection to the present maps.
- 5) For reasons of consistency, coordinates for all localities in table 1 are reported to the nearest 10 meters (UTM grid) and to $1/64$ th of a section (Public Lands subdivision), in spite of location problems as mentioned above. Where some doubt exists for the location shown in table 1, we have noted it as "approximate" in the "Remarks" column.
- 6) Some coal bed thicknesses reported in deep wells drilled for natural gas are not reliable, whether reported by drillers, on-site geologists, or by geologists after laboratory study of the samples. Experience suggests that moderately thick coal beds are slightly exaggerated and that thin beds may be slightly underestimated.

TABLE 1. — BASIC DATA FOR COAL LOCALITIES IN THE STUDY AREA, WEST-CENTRAL ARKANSAS

Quadrangle	ID Number	County ^{1/}	Location							Formation and coal bed ^{2/}	Type of site ^{3/}	Thickness of coal (feet)										Total overburden (feet)	Elevation (feet) Datum mean sea level	Interval to base of next lower coal (feet)	Coal analyses ^{4/}	Sources of data ^{5/}	Remarks							
			Public Lands Subdivisions			UTM Grid System						Note: Thickness of coal beds (C) and partings (P) listed sequentially from the lowest to the highest. A single value can mean that only one bed of coal was encountered or that partings between two or more coal beds were not reported. A (+) sign indicates entire coal sequence was not reported.

TABLE 1.—BASIC DATA FOR COAL LOCALITIES IN THE STUDY AREA, WEST-CENTRAL ARKANSAS (continued)

Quadrangle	ID Number	County ^{1/}	Location							Formation and coal bed ^{2/}	Type of site ^{3/}	Thickness of coal (feet)								Total overburden (feet)	Elevation (feet) Datum mean sea level	Interval to base of next lower coal (feet)	Coal analyses ^{4/}	Sources of data ^{5/}	Remarks							
			Public Lands Subdivisions			UTM Grid System		Note: Thickness of coal beds (C) and partings (P) listed sequentially from the lowest to the highest. A single value can mean that only one bed of coal was encountered or that partings between two or more coal beds were not reported. A (+) sign indicates entire coal sequence was not reported.

TABLE 1.—BASIC DATA FOR COAL LOCALITIES IN THE STUDY AREA, WEST-CENTRAL ARKANSAS (continued)

ID Number	Quadrangle	Country	Location		Public Lands Subdivisions		UTM Grid System		Elevation (feet) Datum mean sea level		Thickness of coal (feet)		Note: Thickness of coal beds (C) and partings (P) listed sequentially from the lowest to the highest. A single value can mean that only one bed of coal was encountered or that partings between two or more coal beds were not reported. A (+) sign indicates entire coal sequence was not reported. TABLE 1.—BASIC DATA FOR COAL LOCALITIES IN THE STUDY AREA, WEST-CENTRAL ARKANSAS (continued)

Quadrangle	ID Number	County ^{1/}	Location								Formation and coal bed ^{2/}	Type of site ^{3/}	Thickness of coal (feet)										Total overburden (feet)	Elevation (feet) Datum mean sea level	Interval to base of next lower coal (feet)	Coal analyses ^{4/}	Sources of data ^{5/}	Remarks								
			Public Lands Subdivisions				UTM Grid System						Note: Thickness of coal beds (C) and partings (P) listed sequentially from the lowest to the highest. A single value can mean that only one bed of coal was encountered or that partings between two or more coal beds were not reported. A (+) sign indicates entire coal sequence was not reported.

TABLE 1. – BASIC DATA FOR COAL LOCALITIES IN THE STUDY AREA, WEST-CENTRAL ARKANSAS (continued)

Quadrangle	ID Number	Location										Formation and coal bed ^{2/}	Type of site ^{3/}	Thickness of coal (feet)										Total overburden (feet)	Elevation (feet) Datum mean sea level	Interval to base of next lower coal (feet)	Coal analyses ^{4/}	Sources of data ^{5/}	Remarks						
		Public Lands Subdivisions			UTM Grid System				Note: Thickness of coal beds (C) and partings (P) listed sequentially from the lowest to the highest. A single value can mean that only one bed of coal was encountered or that partings between two or more coal beds were not reported. A (+) sign indicates entire coal sequence was not reported.

TABLE 1. – BASIC DATA FOR COAL LOCALITIES IN THE STUDY AREA, WEST-CENTRAL ARKANSAS (continued)

Quadrangle	ID Number	Location										Formation and coal bed 2/	Thickness of coal (feet)										Total overburden (feet)	Elevation (feet) Datum mean sea level	Interval to base of next lower coal (feet)	Coal analyses 4/	Sources of data 5/	Remarks				
		Public Lands Subdivisions			UTM Grid System				Note: Thickness of coal beds (C) and partings (P) listed sequentially from the lowest to the highest. A single value can mean that only one bed of coal was encountered or that partings between two or more coal beds were not reported. A (+) sign indicates entire coal sequence was not reported.

TABLE 1.—BASIC DATA FOR COAL LOCALITIES IN THE STUDY AREA, WEST-CENTRAL ARKANSAS (continued)

Quadrangle	ID Number	Location										Formation and coal bed ^{2/}	Type of site ^{3/}	Thickness of coal (feet)										Total overburden (feet)	Elevation (feet) Datum mean sea level	Remarks						
		Public Lands Subdivisions			UTM Grid System				Note: Thickness of coal beds (C) and partings (P) listed sequentially from the lowest to the highest. A single value can mean that only one bed of coal was encountered or that partings between two or more coal beds were not reported. A (+) sign indicates entire coal sequence was not reported.

TABLE 1.—BASIC DATA FOR COAL LOCALITIES IN THE STUDY AREA, WEST-CENTRAL ARKANSAS (continued)

Quadrangle	ID Number	County ^{1/}	Location								Formation and coal bed ^{2/}	Type of site ^{3/}	Thickness of coal (feet)								Total overburden (feet)	Elevation (feet) Datum mean sea level	Interval to base of next lower coal (feet)	Coal analyses ^{4/}	Sources of data ^{5/}	Remarks							
			Public Lands Subdivisions				UTM Grid System						Note: Thickness of coal beds (C) and partings (P) listed sequentially from the lowest to the highest. A single value can mean that only one bed of coal was encountered or that partings between two or more coal beds were not reported. A (+) sign indicates entire coal sequence was not reported.

TABLE 1. – BASIC DATA FOR COAL LOCALITIES IN THE STUDY AREA, WEST-CENTRAL ARKANSAS (continued)

40

Quadrangle	ID Number	County ^{1/}	Location								Formation and coal bed ^{2/}	Type of site ^{3/}	Thickness of coal (feet)								Total overburden (feet)	Elevation (feet) Datum mean sea level	Interval to base of next lower coal (feet)	Coal analyses ^{4/}	Sources of data ^{5/}	Remarks								
			Public Lands Subdivisions				UTM Grid System						Note: Thickness of coal beds (C) and partings (P) listed sequentially from the lowest to the highest. A single value can mean that only one bed of coal was encountered or that partings between two or more coal beds were not reported. A (+) sign indicates entire coal sequence was not reported.

TABLE 1. – BASIC DATA FOR COAL LOCALITIES IN THE STUDY AREA, WEST-CENTRAL ARKANSAS (continued)

Quadrangle	ID Number	County ^{1/}	Location								Formation and coal bed ^{2/}	Type of site ^{3/}	Thickness of coal (feet)								Elevation (feet) Datum mean sea level	Total overburden (feet)	Base of coal	Ground surface	Interval to base of next lower coal (feet) ^{4/}	Coal analyses ^{4/}	Sources of data ^{5/}	Remarks		
			Public Lands Subdivisions			UTM Grid System		Note: Thickness of coal beds (C) and partings (P) listed sequentially from the lowest to the highest. A single value can mean that only one bed of coal was encountered or that partings between two or more coal beds were not reported. A (+) sign indicates entire coal sequence was not reported.

1/ CRF — Crawford
 FRK — Franklin
 JON — Johnson
 LOG — Logan
 POP — Pope
 SCT — Scott
 SEB — Sebastian
 YEL — Yell

2/ SA PA — Paris coal bed (near the top of Savanna Formation)
 SA U — Unnamed coal bed in upper one-third of Savanna Formation
 SA M — Unnamed coal bed in middle one-third of Savanna Formation
 SA L — Unnamed coal bed in lower one-third of Savanna Formation
 SA CH — Charleston coal bed (in lower part of Savanna Formation)
 MA U — Unnamed coal bed in upper one-third of McAlester Formation
 MA M — Unnamed coal bed in middle one-third of McAlester Formation
 MA UH — Upper Hartshorne coal bed (in lower part of McAlester Formation)
 MA LH — Lower Hartshorne coal bed (in lower part of McAlester Formation)
 AT — Unnamed coal bed in Atoka Formation

3/ TP — Tipple
 ME — Mine entry
 MW — Mine working (underground)
 ST — Strip mine
 PP — Prospect pit
 SH — Shallow (exploration) hole
 DW — Deep well (drilled for natural gas)
 OT — Outcrop (other than those above)

4/ A: Analyses included in Table 2; A+: Analyses included in Tables 2 through 5.

5/ Numbers identify titles in "List of References" at end of Tables.

1/ Locality numbers used in Arkansas Geological Commission IC 20-K

2/ SA PA — Paris coal bed (near the top of Savanna Formation)
SA U — Unnamed coal bed in upper one-third of Savanna Formation
SA M — Unnamed coal bed in middle one-third of Savanna Formation
SA L — Unnamed coal bed in lower one-third of Savanna Formation
SA CH — Charleston coal bed (in lower part of Savanna Formation)
MA U — Unnamed coal bed in upper one-third of McAlester Formation
MA M — Unnamed coal bed in middle one-third of McAlester Formation
MA UH — Upper Hartshorne coal bed (in lower part of McAlester Formation)
MA LH — Lower Hartshorne coal bed (in lower part of McAlester Formation)
AT — Unnamed coal bed in Atoka Formation

3/ TP — Tipple
ME — Mine entry
MW — Mine working (underground)
ST — Strip mine
PP — Prospect pit
SH — Shallow (exploration) hole
DW — Deep well (drilled for natural gas)
OT — Outcrop (other than those above)

4/ 1, as received; 2, moisture free; 3, moisture and ash free

5/ A, Laboratory report from U. S. Bureau of Mines;
B, U. S. Bureau of Mines Technical Paper 416;
C, U. S. Geological Survey Bulletin 847-E.

TABLES 3, 4, & 5

TABLE 3.--MAJOR, MINOR, AND TRACE-ELEMENT COMPOSITION OF COAL SAMPLES FROM ARKANSAS, REPORTED ON WHOLE-COAL BASIS

[Values are in either percent or parts per million. Si, Al, Ca, Mg, Na, K, Fe, Mn, Ti, P, Cl, Cd, Cu, Li, Pb, and Zn values were calculated from analysis of ash. As, F, Hg, Sb, Se, Th, and U values are from direct determination on air dried (32° C) coal. The remaining analyses were calculated from spectrographic determination on ash. An L after a value means less than the value shown, N means not detected, B means not determined, G means less than 10% or less than value shown, and — means not looked for. Sample KV 19 is from an Atoka coal bed, samples PA 37 and PA 41 are from the Paris coal bed in the Savanna Formation, and the remaining samples are from the Lower Hartshorne coal bed in the McAlester Formation.]

Sample numbers: The top number is the Quadrangle code and locality identification number used in this report. The number in parentheses is the U. S. Geological Survey laboratory number.

Millard, G. O. Riddle, G. D. Shipley, J. A. Thomas, R. J. Vinnola, J. S. Wahlberg, R. J. White, and R. J. Young.

Data compiled by Boyd R. Haley, U. S. Geological Survey in cooperation with the Arkansas Geological Commission.

TABLE 4. MAJOR AND MINOR OXIDE AND TRACE-ELEMENT COMPOSITION OF THE LABORATORY ASH OF COAL SAMPLES FROM ARKANSAS

[Values are in either percent or parts per million. The coals were ashed at 525° C. An L after a value means less than the value shown, N means not detected, B means not determined, and -- means not looked for. S after the element title means that the values listed were determined by semiquantitative spectrographic analysis. The spectrographic results are to be identified with geometric brackets whose boundaries are 1.2, 0.83, 0.56, 0.38, 0.26, 0.18, 0.12, etc., but are reported arbitrarily as mid-points of these brackets, or two brackets at 95-percent confidence. Sample KV 19 is from an Atoka coal bed, samples PA 37 and PA 41 are from the Paris coal bed in the Savanna Formation, and the remaining samples are from the Lower Hartshorne coal bed in the McAlester Formation.]

Sample numbers: The top number is the quadrangle code and locality identification number used in this report. The number in parentheses is the U. S. Geological Survey laboratory number.

TABLE 3A. — MAJOR, MINOR, AND TRACE-ELEMENT COMPOSITION OF COAL SAMPLES FROM ARKANSAS, REPORTED ON WHOLE-COAL BASIS

[Values are in either percent or parts per million. Si, Al, Ca, Mg, Na, K, Fe, Mn, Ti, P, Cl, Cd, Cu, Li, Pb, and Zn values were calculated from analysis of ash. As, F, Hg, Sb, Se, Th, and U values are from direct determination on air dried (32° C) coal. The remaining analyses were calculated from spectrographic determination on ash. An L after a value means less than the value shown, N means not detected, B means not determined, G means less than 10% or less than value shown, and — means not looked for. Sample D179994, D175929, and D179993 are from the Charleston coal bed in the Savanna Formation; sample D189166 is from an Atoka coal bed; and the remaining samples are from the Lower Hartshorne coal bed in the McAlester Formation. These samples are from localities outside the study area. UTM coordinates are given in Table 6.]

Sample numbers: U. S. Geological Survey laboratory number.

Data compiled by Boyd R. Haley, U. S. Geological Survey in cooperation with the Arkansas Geological Commission.

TABLE 4A. -- MAJOR AND MINOR OXIDE AND TRACE-ELEMENT COMPOSITION OF THE LABORATORY ASH OF COAL SAMPLES FROM ARKANSAS

[Values are in either percent or parts per million. The coals were ashed at 525° C. An L after a value means less than the value shown. N means not detected, B means not determined, and — means not looked for. S after the element title means that the values listed were determined by semiquantitative spectrographic analysis. The spectrographic results are to be identified with geometric brackets whose boundaries are 1.2, 0.83, 0.56, 0.38, 0.26, 0.18, 0.12, etc., but are reported arbitrarily as mid-points of these brackets, or two brackets at 95-percent confidence. Samples D179994, D175929, and D179993 are from the Charleston coal bed in the Savanna Formation; sample D189166 is from an Atoka coal bed, and the remaining samples are from the Lower Hartshorne coal bed in the McAlester Formation. These samples are from localities outside the study area. UTM coordinates are given in Table 6.]

COAL LOCALITIES, ABBOTT QUADRANGLE, ARKANSAS
EXPLANATION

COAL SITES

Type of locality indicated by symbol.

-  Outcrop
 -  Strip mine
 -  Mine entry or slope
 -  Mine shaft
 -  Site in underground min
 -  Shallow drill hole
 -  Deep Wells
(dry hole, gas show, gas well)

OUTCROP OF COAL BEDS

(Coal present on patterned side of line)

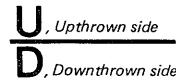

- The figure displays a geological cross-section with five entries, each consisting of a horizontal line with specific symbols above it and descriptive text below it. The formations from top to bottom are:

 - Upper Hartshorne coal bed (in McAlester Formation)**: Above the line, there are three small black dots. Below the line, the text reads "Upper Hartshorne coal bed (in McAlester Formation)".
 - Lower Hartshorne coal bed (in McAlester Formation)**: Above the line, there are two downward-pointing chevrons. Below the line, the text reads "Lower Hartshorne coal bed (in McAlester Formation)".
 - Unnamed coal bed in Atoka Formation**: Above the line, there are three short horizontal dashes. Below the line, the text reads "Unnamed coal bed in Atoka Formation".
 - Charleston coal bed (in Savanna Formation)**: Above the line, there are five small black dots. Below the line, the text reads "Charleston coal bed (in Savanna Formation)".
 - Unnamed coal bed in McAlester Formation**: Above the line, there are two small black dots. Below the line, the text reads "Unnamed coal bed in McAlester Formation".

 -  Deep Wells
(drill hole, gas show, gas well)

OUTCROP OF COAL BEDS

(Coal present on patterned side of line)

- The diagram illustrates a geological cross-section with five horizontal lines representing different geological formations. From top to bottom:

 - Paris coal bed (in Savanna Formation)**: Indicated by three vertical tick marks on the top line.
 - Upper Hartshorne coal bed (in McAlester Formation)**: Indicated by three black dots on the second line from the top.
 - Lower Hartshorne coal bed (in McAlester Formation)**: Indicated by three black arrows pointing upwards on the third line from the top.
 - Charleston coal bed (in Savanna Formation)**: Indicated by four vertical tick marks on the fourth line from the top.
 - Unnamed coal bed in Atoka Formation**: Indicated by two horizontal tick marks on the bottom line.
 - Unnamed coal bed in McAlester Formation**: Indicated by three black dots on the line below the Atoka Formation.

EXPLANATION

GOAL SITES

Type of locality indicated by symbol.

-  Outcrop
 -  Strip mine
 -  Mine entry or slope
 -  Mine shaft
 -  Site in underground mine
 -  Shallow drill hole
 -  Deep Wells
(dry hole, gas show, gas well)

OUTCROP OF COAL BEDS

(Coal present on patterned side of line)

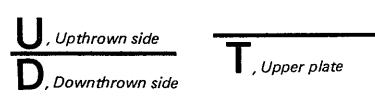

- The diagram illustrates a geological cross-section with five distinct coal bed locations marked by horizontal lines and dots. The formations and their associated coal beds are:

 - Paris coal bed (in Savanna Formation)**: Located at the top left, marked by a single dot on a horizontal line.
 - Unnamed coal bed in Savanna Formation**: Located in the middle left, marked by two dots on a horizontal line.
 - Charleston coal bed (in Savanna Formation)**: Located in the bottom left, marked by four dots on a horizontal line.
 - Upper Hartshorne coal bed (in McAlester Formation)**: Located at the top right, marked by three dots on a horizontal line.
 - Lower Hartshorne coal bed (in McAlester Formation)**: Located in the middle right, marked by two dots on a horizontal line.
 - Unnamed coal bed in Atoka Formation**: Located at the bottom right, marked by three dots on a horizontal line.
 - Unnamed coal bed in McAlester Formation**: Located at the bottom center, marked by two dots on a horizontal line.

- The figure displays a geological cross-section with five horizontal lines representing different geological formations. From top to bottom:

 - Paris coal bed (in Savanna Formation)**: Indicated by three vertical tick marks.
 - Upper Hartshorne coal bed (in McAlester Formation)**: Indicated by three black dots.
 - Unnamed coal bed in Savanna Formation**: Indicated by three vertical tick marks.
 - Lower Hartshorne coal bed (in McAlester Formation)**: Indicated by two diagonal tick marks.
 - Charleston coal bed (in Savanna Formation)**: Indicated by five vertical tick marks.
 - Unnamed coal bed in Atoka Formation**: Indicated by three horizontal tick marks.
 - Unnamed coal bed in McAlester Formation**: Indicated by three black dots.

EXPLANATION

COAL SITES

Type of locality indicated by symbol.

-  Outcrop
 -  Strip mine
 -  Mine entry or slope
 -  Mine shaft
 -  Site in underground min.
 -  Shallow drill hole
 -  Deep Wells
(dry hole, gas show, gas well)

OUTCROP OF COAL BEDS

(Coal present on patterned side of line)

- The diagram illustrates the relative positions of several coal beds across different geological formations. The formations are represented by horizontal lines with tick marks indicating their thickness. Coal beds are shown as vertical lines with dots at their top and bottom boundaries.

 - Paris coal bed (in Savanna Formation):** Located near the top of the Savanna Formation, indicated by a horizontal line with three tick marks.
 - Unnamed coal bed (in Savanna Formation):** Located in the middle of the Savanna Formation, indicated by a horizontal line with three tick marks.
 - Charleston coal bed (in Savanna Formation):** Located near the bottom of the Savanna Formation, indicated by a horizontal line with five tick marks.
 - Upper Hartshorne coal bed (in McAlester Formation):** Located in the upper part of the McAlester Formation, indicated by a horizontal line with three tick marks.
 - Lower Hartshorne coal bed (in McAlester Formation):** Located in the middle part of the McAlester Formation, indicated by a horizontal line with three tick marks.
 - Unnamed coal bed in Atoka Formation:** Located in the lower part of the Atoka Formation, indicated by a horizontal line with three tick marks.
 - Unnamed coal bed in McAlester Formation:** Located in the upper part of the McAlester Formation, indicated by a horizontal line with three tick marks.

EXPLANATION

COAL SITES

Type of locality indicated by symbol.

- Outcrop
 - Strip mine
 - Mine entry or slope
 - Mine shaft
 - Site in underground mine
 - Shallow drill hole
 - Deep Wells
(dry hole, gas show, gas well)

OUTCROP OF COAL BEDS

(Coal present on patterned side of line)

- The diagram illustrates a geological cross-section with various horizontal lines representing different geological formations. Coal beds are indicated by specific symbols: black dots for Upper Hartshorne, white circles for Lower Hartshorne, and short vertical lines for unnamed beds. The formations shown from top to bottom are:

 - Paris coal bed (in Savanna Formation)**: Indicated by two black dots.
 - Upper Hartshorne coal bed (in McAlester Formation)**: Indicated by three black dots.
 - Unnamed coal bed in Savanna Formation**: Indicated by three white circles.
 - Lower Hartshorne coal bed (in McAlester Formation)**: Indicated by two white circles.
 - Charleston coal bed (in Savanna Formation)**: Indicated by four short vertical lines.
 - Unnamed coal bed in Atoka Formation**: Indicated by three short vertical lines.
 - Unnamed coal bed in McAlester Formation**: Indicated by four black dots.
